UltraIII and Copper

Replacing minerals after Chelation therapy with Calcium EDTA IV

When chelating with Calcium EDTA or any other chelating agent, the toxic metals will be pulled out of the tissue and into the bloodstream and excreted through the urine. In this process, some essential minerals are also pulled out of the body. To replace these minerals, we are having you take a multi-vitamin called Ultra Preventative III and a copper supplement. There are two version of Ultra Preventative III (one with copper and one without copper). Please check the bottle and directions below for correct supplementation directions.

Directions for "Ultra Preventative III with Copper" + "Copper":

Take 3 "Ultra Preventative III with Copper" twice a day with meals and 1 "Copper" pill once a day.

Directions for "Ultra Preventative III" and "Copper":

Take 3 "Ultra Preventative III" twice a day with meals and 2 "Copper" pills once a day.
